Collective Consciousness

In today's society, religion creates social interaction and collective gathering with a strong belief system. In 19 century the belief of "changeling" was very common in most parts of Europe and mostly in Ireland. An Irish poet William Butler Yeats gave us a clear summary of how changeling was believed to be fairies who stole children and cause misfortune and poverty. One of his most interesting stories on changeling had a huge effect on emotional feelings tangled with anger and fear.

Our brains develop an emotional connection response to enable us to remember repeated actions. Animals that experience the increase in the size of the Nominin Neocortex can store pieces of information from the past, also they can reclaim the information when needed. Concerning that, society has become larger and more complex on the same spiritual beliefs.

In chapter 5, Maryanski's cladistic analysis concludes that the Gorillas, chimpanzees, orangutans, and humans share 99% of their DNA. the Great ape rolls its world similar to humans with the concept of independent and interpersonal interactions. The theory that states that humans have the ability in making meaningless spiritual opinions meaningful are brought in through ritual patterns, which declares that we interact with a stable pattern over time.
